

INTERNAL BRIEFING • CONFIDENTIAL

OPS-AI

The operations copilot built into
our booking system.

A single assistant — typed or spoken — that
understands every booking, finds records in seconds,
and drafts routine changes for one-click approval. It
never acts on its own: every change to the database is
confirmed by a person first.

01 What OPS-AI is

OPS-AI is an operations copilot embedded directly inside the AppleHolidays platform. Staff open it with a single keystroke on any screen, ask for what they need in plain English — by typing or by voice — and it responds with the answer, opens the right page, or drafts the exact change to a booking. It is not a separate app and not a generic chatbot: it knows our bookings, our workflow, and our rules.

11

Built-in actions it can perform

4

Countries & booking types it understands

2

Ways to use it — type or talk

100%

Of changes confirmed by a person

Why it is different from a chatbot

A chatbot only talks. OPS-AI **proposes concrete, executable actions** — "update this field", "add this tour day", "assign this driver" — that a staff member approves with one click. It reads real records with real IDs before it drafts anything, so its proposals are accurate, not guesses.

It stays inside its lane

Every user only ever sees and edits bookings for **their own country and their own role** — OPS-AI inherits exactly those limits from the person using it. It cannot widen its own reach, and it has **no ability to delete, cancel, change status, touch payments, or manage users.**

In one sentence: OPS-AI turns a multi-step, click-heavy task into a single plain-English instruction — while keeping a human firmly in control of every change and every permission.

How a request flows

02 What it can do

OPS-AI has **11 built-in actions**, grouped into three kinds. Look-ups and navigation happen instantly; anything that changes data is always drafted for approval, never executed on its own.

● LOOK UP — runs instantly

Search bookings

Find bookings by reference, IS number, agent, file handler, passenger, status or arrival date.

Read a booking

Pull full detail — passengers, hotels, tour agenda, P&L totals — to answer or to prepare an edit.

● NAVIGATE — runs instantly

Open a booking

Jump straight to any booking's detail page.

Go to a filtered page

e.g. "all arrivals on 1 July" — opens the list already filtered.

● CHANGE — always confirmed first

Update a booking field

Agent, file handler, dates, pax counts, contacts, notes and 30+ other fields.

Add a tour agenda item

A new sightseeing day, transfer or activity — by tour day number or date.

Edit a tour agenda item

Change timings, route, meal plan or service type on an existing movement.

Update accommodation

Hotel, city, room type, meal plan, check-in / check-out and nights.

Assign a driver / vehicle

Attach a driver, vehicle or vendor to a movement.

Create a reminder

Schedule a follow-up, payment or call reminder against a booking.

Log a customer contact

Record a call, email or WhatsApp in the contact log.

The 11 actions at a glance

■ Look up (read-only) ■ Navigate ■ Change (confirmed)

03 What it looks like in practice

Real examples of instructions a staff member can give, and how OPS-AI responds. Notice that every change comes back as a **preview card the operator taps to confirm**.

STAFF

Add a full-day Sigiriya sightseeing tour on day 3 of IS23492

OPS-AI

 **IS23492 · new agenda item**

Date: day 3 · **Activity:** Sigiriya

Details: Full-day sightseeing — Sigiriya Rock Fortress & Dambulla Cave Temple

Service: Internal tour

✓ Confirm & add

STAFF

Which bookings arrive on 1 July?

OPS-AI

 **Found 6 bookings — shown in chat**

Returns the matching rows instantly (reference, agent, pax, status), and offers a button to open the filtered list on screen. **No confirmation needed — nothing was changed.**

STAFF

Assign driver Nuwan, van CAB-4471, to the airport pickup on this booking

OPS-AI

 **VN40123 · Airport pickup**

Driver: — → Nuwan · **Vehicle:** — → CAB-4471

✓ Confirm assignment

STAFF 

(spoken) "Remind me to chase the balance payment on this file next Monday."

OPS-AI

 **Reminder**

Title: Chase balance payment · **When:** next Monday 09:00

✓ Confirm reminder

"I've put that reminder up for you to confirm." — spoken back aloud

04 Built to be safe by design

This is a live system holding real booking and financial records, so safety was the starting point, not an afterthought. Every action OPS-AI proposes passes through **five mandatory checks** before anything is saved.

1

Only known actions exist

OPS-AI can only perform the 11 actions on the approved list. Anything outside it is refused outright — it cannot invent new powers.

2

Your role is re-checked

The user's real permissions are verified for each action. If your role can't do something by hand, OPS-AI can't do it for you.

3

Country scope is enforced

Staff only reach bookings for their assigned country — the same boundary applies to everything OPS-AI touches.

4

Every value is validated

Dates, numbers and fields are checked against a fixed whitelist. Only real, in-range values reach the database.

5

A person confirms, and it's logged

Nothing is saved until a staff member taps confirm — and every change is written to the audit trail, tagged as made via OPS-AI.

✓ What it can do

- ✓ Search, read and open any booking in your scope
- ✓ Draft edits to booking details, agenda, hotels & drivers
- ✓ Create reminders and log customer contacts
- ✓ Answer questions and navigate the app for you

✗ What it can never do

- ✗ Delete or cancel a booking
- ✗ Move a booking's status or confirm payments
- ✗ Create, change or remove users and roles
- ✗ Run database commands or act without approval

The key guarantee: OPS-AI proposes; a person decides. It has no path to the destructive or financially binding operations — those stay behind the normal screens, exactly where they are today.

05 Why it matters for the team

The everyday win is **time**. Routine jobs that mean hopping across several screens and forms become a single instruction. The chart below is an illustrative comparison of the hands-on steps for four common tasks.

Hands-on steps to complete a task — manual vs OPS-AI (illustrative)

Illustrative estimate of hands-on steps for typical tasks; actual counts vary by booking and screen.

Hands-free voice mode

OPS-AI also works by voice. A file handler on a call can ask it to look something up or draft a change out loud — useful while multitasking. The spoken assistant follows the **exact same rules**: it can look things up freely, but any change still becomes a confirmation card to tap.

Where the value lands

Speed — routine edits in one line instead of several screens. **Accuracy** — it reads the real record before drafting, and shows a before/after preview. **Consistency** — the same guardrails apply to everyone, every time, all logged.

Recommendation: OPS-AI is already live in the platform. A short walkthrough for each country team would let us gather feedback and confirm the everyday time savings across Booking, Ground and Travel Experience.
